3 Steps To Avoid That Sinking Feeling...

Helping you build

Better | Faster | Stronger

ULTRA[®]
CRETE

We all know the frustration, cost and hassle of driving over sunken carriageway ironwork. Check out our simple guide to solving this common problem.

Detailed research carried out on behalf of the Highways Agency in 2002 identified the bedding mortar as the primary point of failure for carriageway ironwork.

This led to a specification for high performance bedding mortar being required on all carriageway ironwork.

Known today as CD534 for NI and Series 500 for ROI, it requires mortars to achieve the following in 3 hours.

Workability time - 15 mins
Compressive Strength 30N/mm²
Tensile Strength 5N/mm²

Achieving these properties is very difficult, but we've cracked it!

High Performance Bedding Mortar

Emtek Envirobed

Select Emtek Envirobed to bed your frame and cover on. This will exceed CD534 requirements, providing world-class compressive, tensile and flexural strength.

- 53N/mm² compressive strength in 3 hours
- 6.10N/mm² tensile strength in 3 hours
- 12N/mm² flexural strength in 3 hours
- Set time: 30 minutes
- Workability: 15 mins

Emtek Envirobed is red in colour, making it easy to identify and audit your network.

Ensuring the backfill around your reinstatement is compacted, solid and secure is essential to the longevity of the reinstatement.

We've been pioneering best practice backfill techniques and solutions for over 25 years.

By adding a shrinkage compensated, ultra-high strength, very rapid setting flowable concrete gives you the assurance and confidence to know your backfill is robust and ready to receive the wearing course.

Rapid Strength Backfill Concrete

Emtek QC10F

Emtek QC10F is a high flow, rapid strength concrete, creating a secure backfill to support and lock in the frame and cover. This provides a bulletproof backfill to enable the wearing course to be applied.

- Workability time: 5-10 minutes
- Rapid set time: 10-20 minutes
- 20N/mm² compressive strength in 2 hours
- HAPAS approved since 2005

Emtek QC10F is easy to mix and apply. It's rapid setting to get the job completed quickly.

You've done all the hard work, so don't forget the crucial edge sealing process to ensure there is no water ingress around your frame and cover, or the edge of your reinstatement.

The days of brushing on a bitumen emulsion or pouring liquid hot-pour tar are gone.

The latest technology and most environmentally friendly technique is with spray-applied bitumen.

Bitumen Edge Sealer

Emtek SCJ

Sealing the vertical edges of all the joints with Emtek SCJ is crucial in preventing water ingress prior to wearing course application. This prevents the deterioration from any freeze-thaw effect throughout the year. Supplied in a super-handy, spray-applied tin, Emtek SCJ makes the process fast and easy.

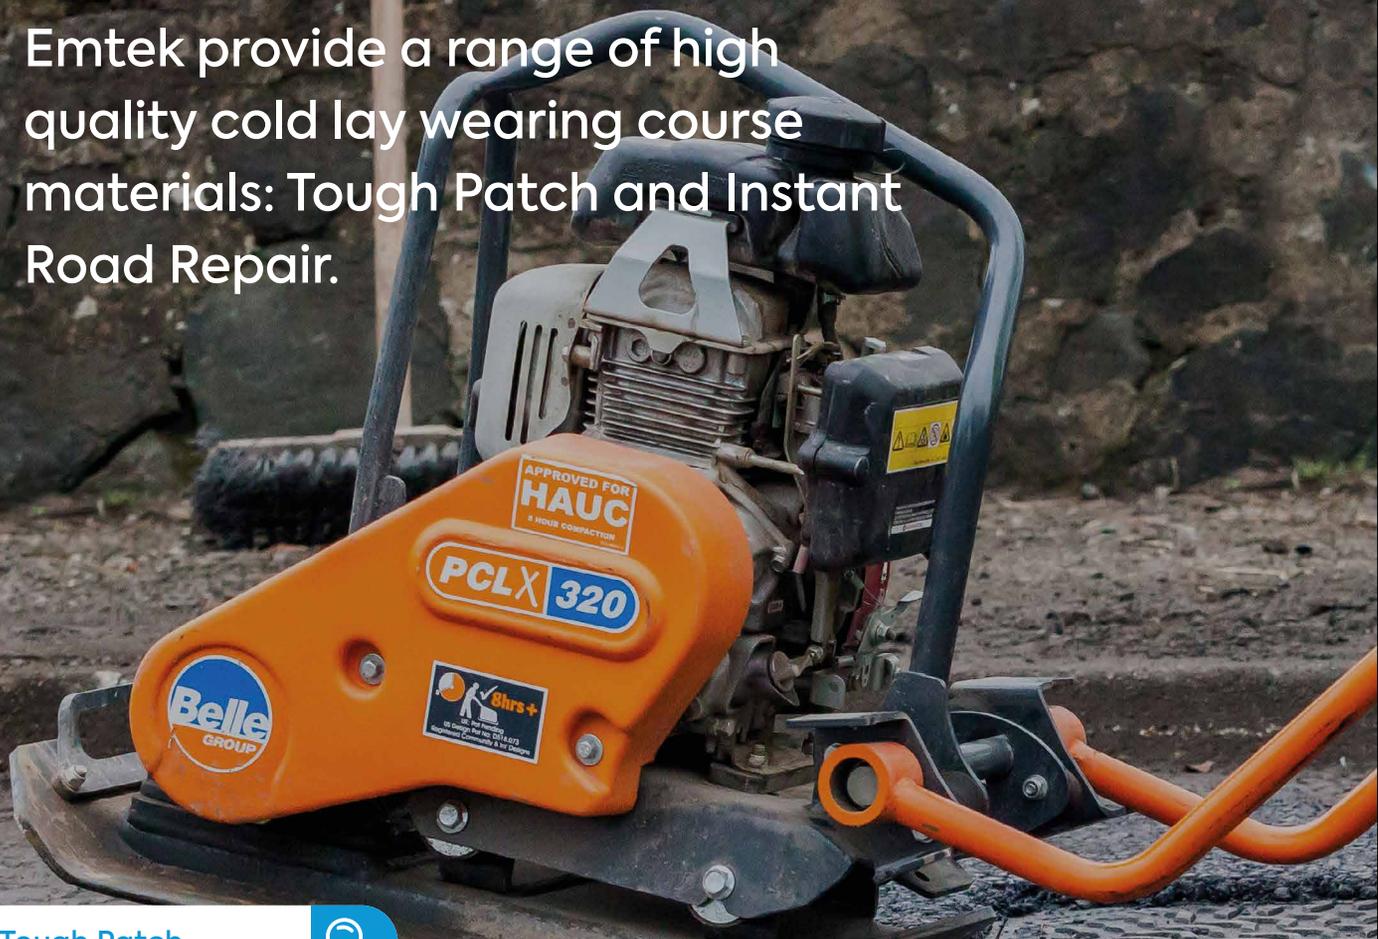

- Can be used in all weathers
- Simple and economical to apply
- No waste
- Coverage: 10 linear metres, based on width of 60mm and 2mm thickness

Emtek SCJ allows you to seal the vertical edges, fast!

Wearing Course

Emtek provide a range of high quality cold lay wearing course materials: Tough Patch and Instant Road Repair.

Tough Patch

Emtek Tough Patch is rapid curing, permanent cold-lay surfacing material suitable for defect repairs, potholes, trench reinstatement, utility installations, patching in car parks, driveways and other local repairs.

- First-time permanent
- Instantly trafficable
- Minimal traffic management, labour and waste

Our third-party accredited cold lay materials are a suitable alternative to traditional hot lay wearing course materials.

Instant Road Repair

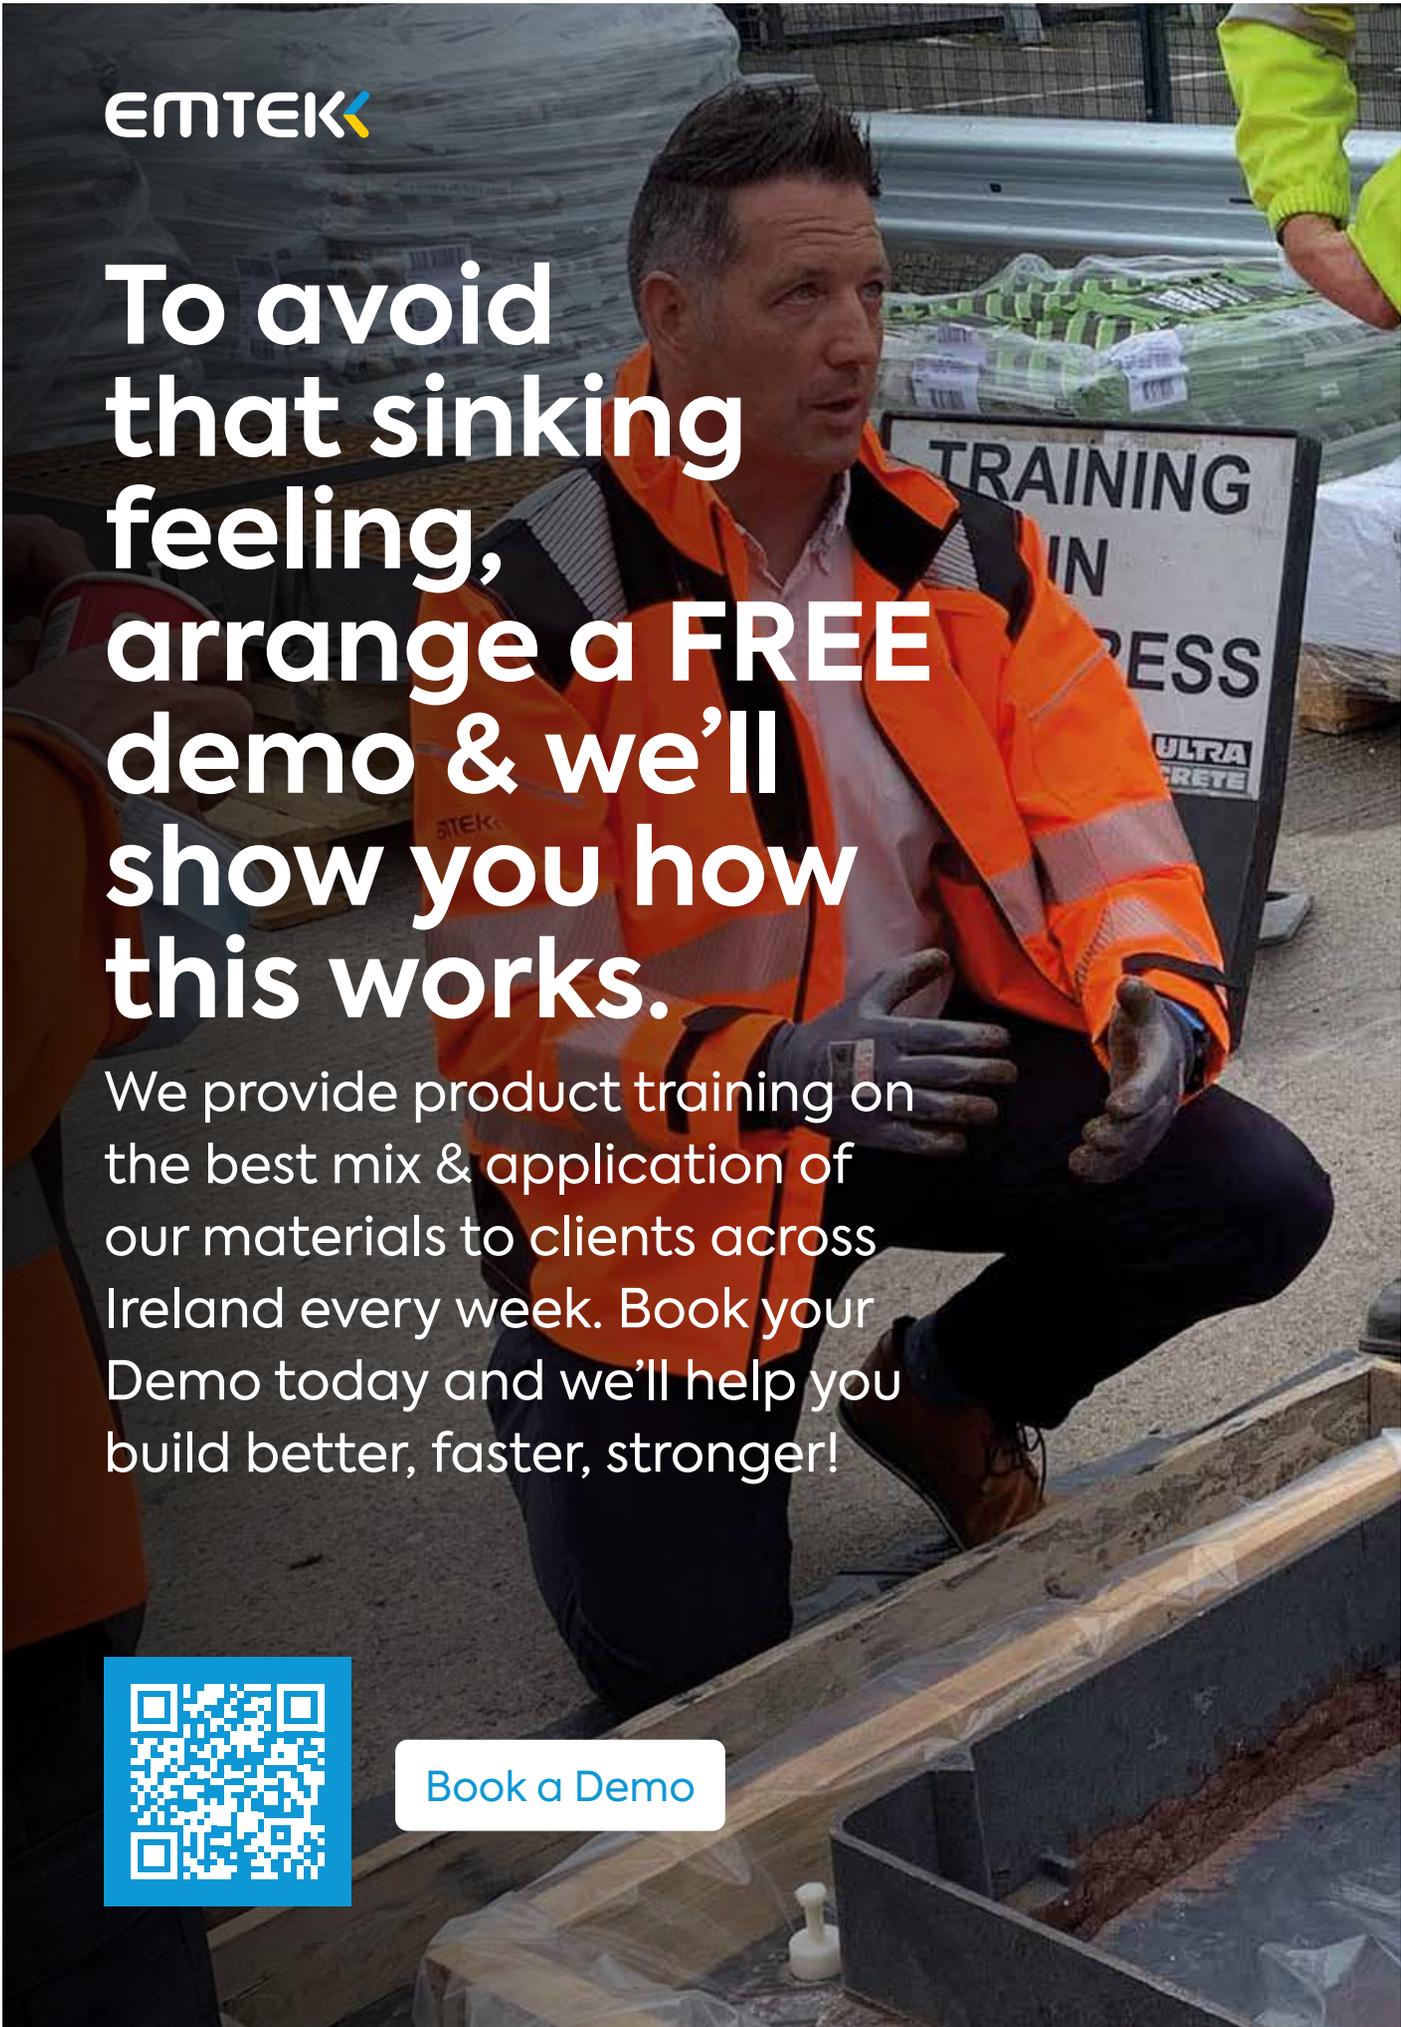

Emtek Instant Road Repair is designed for permanent asphalt repairs in footways, footpaths and cycle tracks. It gained HAPAS approval in 2002, and is instantly trafficable causing minimal disruption to pedestrians.

- Suitable for planned & reactive repairs
- Can be used in all weathers
- Depth: 15-100mm
- Reusable tubs – no waste

The EMTEK logo is located in the top left corner of the page. It consists of the word "EMTEK" in a bold, sans-serif font, with a blue and yellow graphic element to the right of the letters "K".

EMTEK

A man in an orange high-visibility jacket is kneeling on a construction site, talking to someone off-camera. He is wearing a white shirt underneath and dark trousers. In the background, there is a sign that reads "TRAINING IN PROGRESS" and "ULTRA CONCRETE". The scene is outdoors with various construction materials and equipment visible.

To avoid
that sinking
feeling,
arrange a **FREE**
demo & we'll
show you how
this works.

We provide product training on the best mix & application of our materials to clients across Ireland every week. Book your Demo today and we'll help you build better, faster, stronger!
